Motherhood effects

Results on Pool Sample: Employment

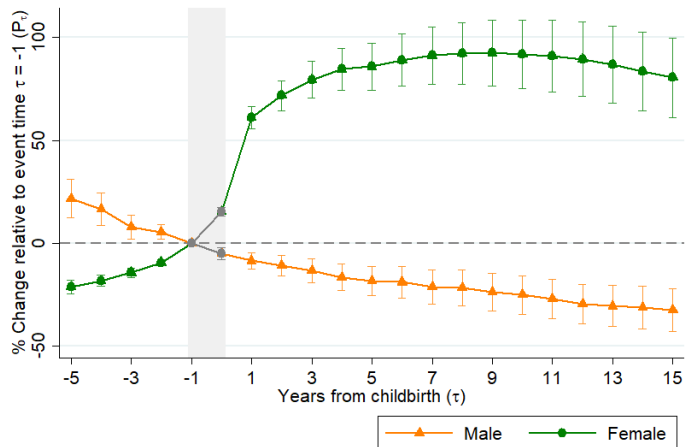

Bootstrap SE, 500 replications. 90% CI. Long-run child penalty (event time 15)= 21.38 %
Female mean dependent variable at event time -1: 72.12 %

[Foward to Pool Marriage](#)

[Working by Region](#)

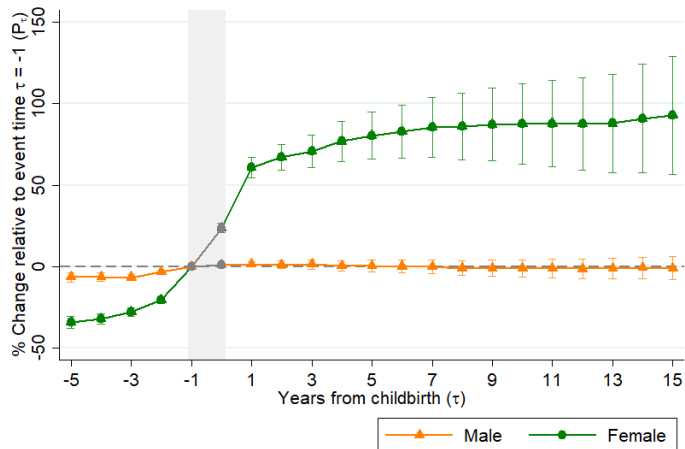

Figure: Parenthood effects on employment

Results on Pool Sample: Part-time employment

Bootstrap SE, 500 replications. 90% CI. Long-run child penalty (event time 15)= -90.13 %
Female mean dependent variable at event time -1: 7.82 %

Results on Pool Sample: Self-employment

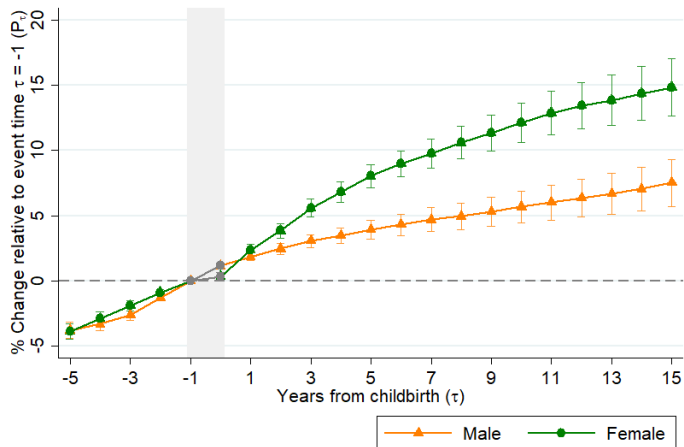

Bootstrap SE, 500 replications. 90% CI. Long-run child penalty (event time 15)= -93.73 %
Female mean dependent variable at event time -1: 4.39 %

► Who are the SE?

► SE by Region

Figure: Parenthood effects on self-employment

Results on Pool Sample: Number of jobs

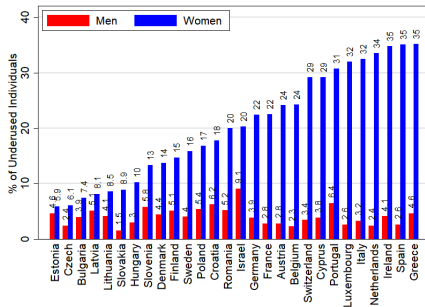

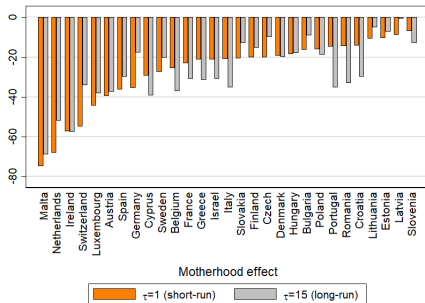

Bootstrap SE, 500 replications. 90% CI. Long-run child penalty (event time 15) = -0.06 %
Female mean dependent variable at event time -1: 1.51

Consequences:

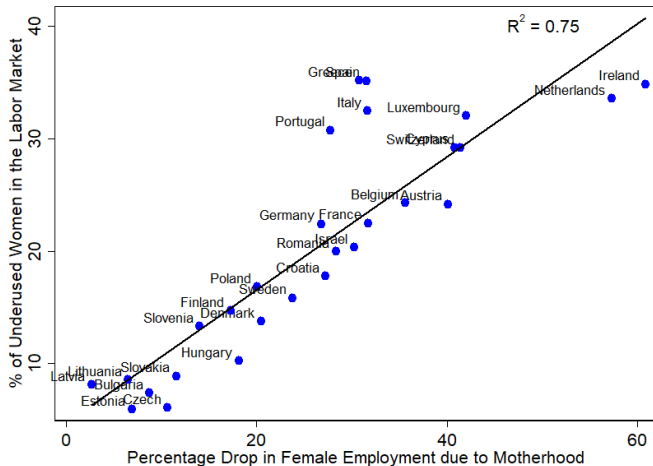

Changes in the allocation of talent

The Allocation of Talent

The Allocation of Talent

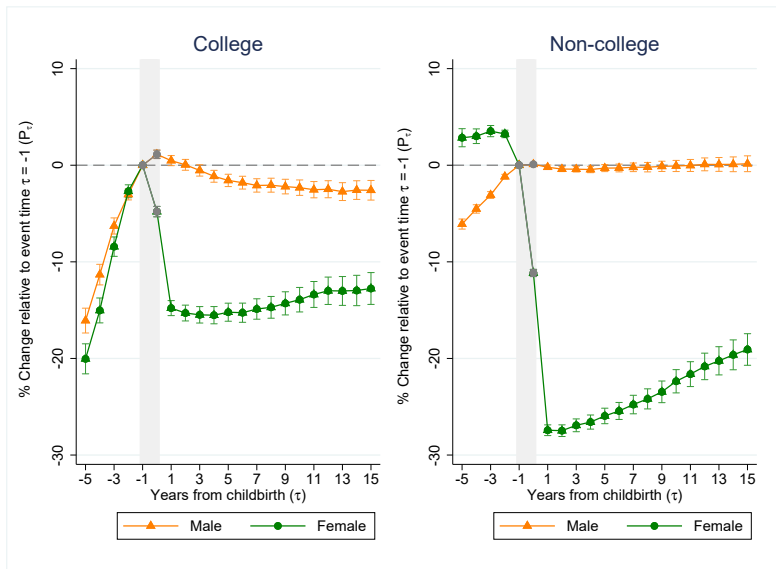

Figure: Relation between Motherhood Effects and % Underutilization

The Allocation of Talent

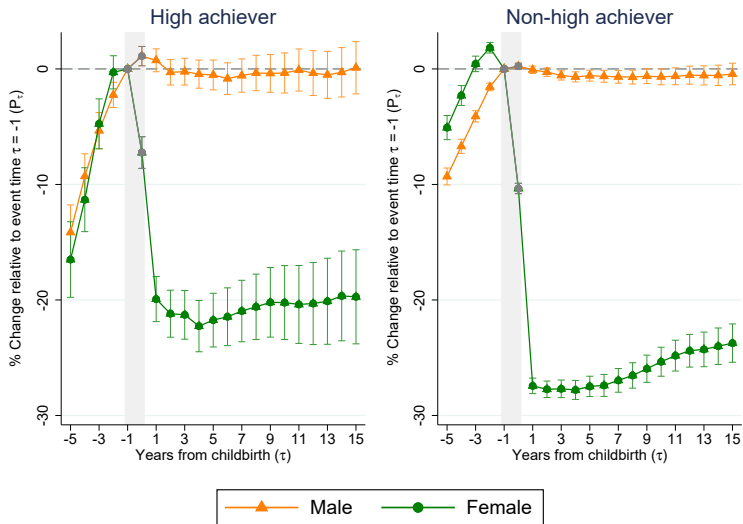

- Analyze allocation of talent in the extensive and intensive margins
- Assess whether in response to motherhood the occupational choices women change in a way that is **consistent with misallocation of talent**:
 - 1 a rise in job instability;
 - 2 highly educated (even those more educated than husbands) and highly skilled women leaving the labor force;
 - 3 highly educated and highly skilled individuals engaging in part-time work;
 - 4 women with relatively low entrepreneurial ability becoming entrepreneurs.
- Three measures of talent/ability:
 - Educational attainment
 - Math ability at age 10
 - Personality traits (related to entrepreneurship: "openness to experience" and "extraversion")

The allocation of talent: Looking at Education

(a) Employment

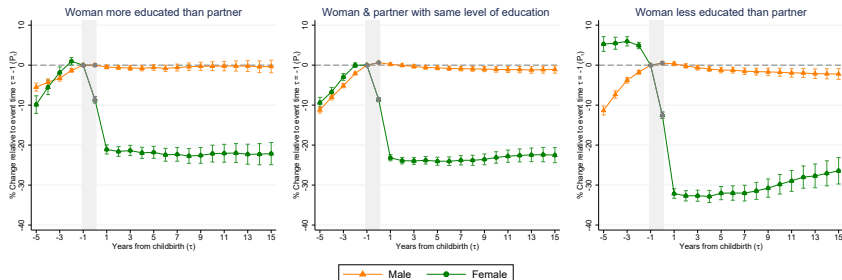

The allocation of talent: Looking at Childhood Math Ability

(a) Employment

The allocation of talent: Looking at Spousal Education Gap

Motherhood or Pregnancy?: Pregnancies that do not end in live births vs. first-childbirth effects

We restrict to women whose first pregnancy ended in a non-live birth or termination and either did not have children within the following four years or to those who had a child.
