

Economía Computacional -- Maestría en Economía UNLP

Extensiones Modelo EGC para Economía Abierta y Pequeña: Curva de Salarios

Martín Cicowiez
(CEDLAS-UNLP)

FCE-UNLP
Mayo 19, 2021

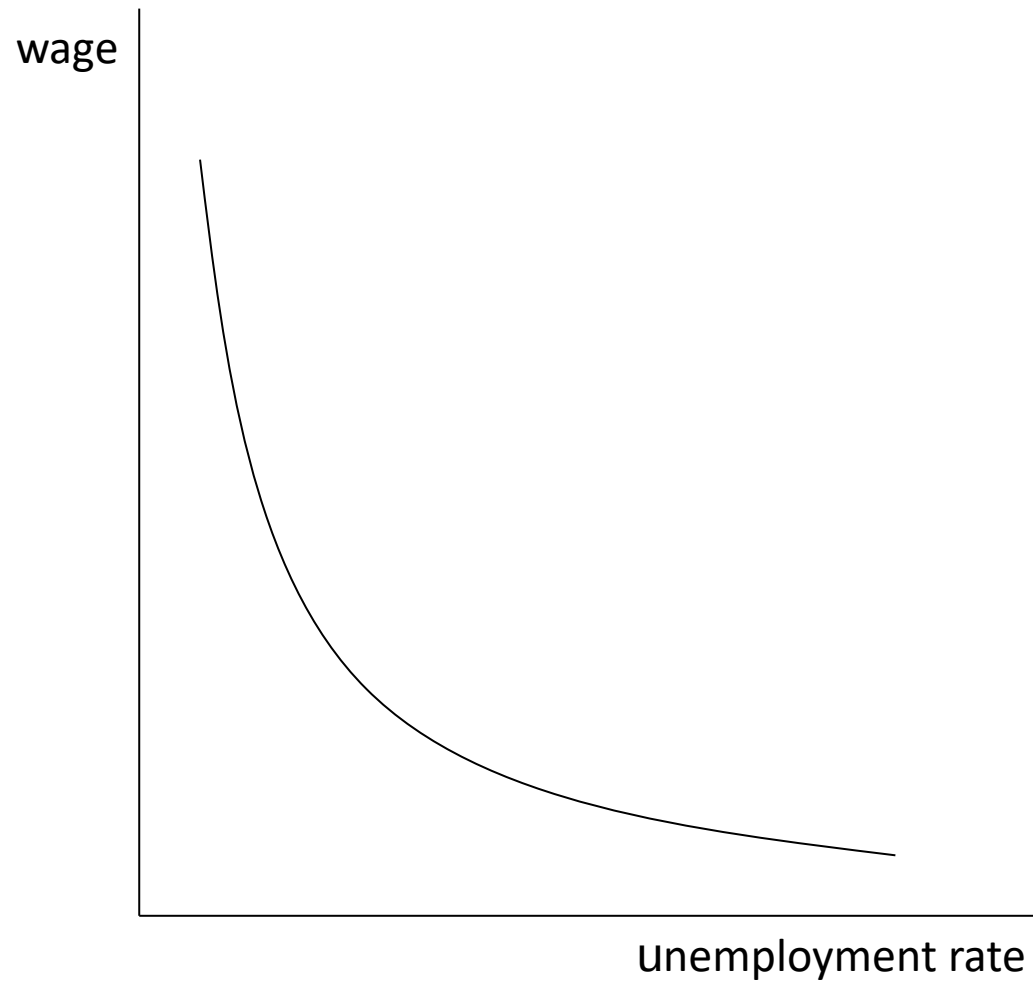

Introducción

- En esta clase mostraremos cómo extender el modelo SOE para incluir
 - desempleo con curva de salarios
- En próximas sesiones veremos cómo incorporar
 - múltiples hogares
 - funciones de producción tipo CES
 - más de dos factores
 - funciones de utilidad tipo Stone-Geary
 - cálculo variación equivalente

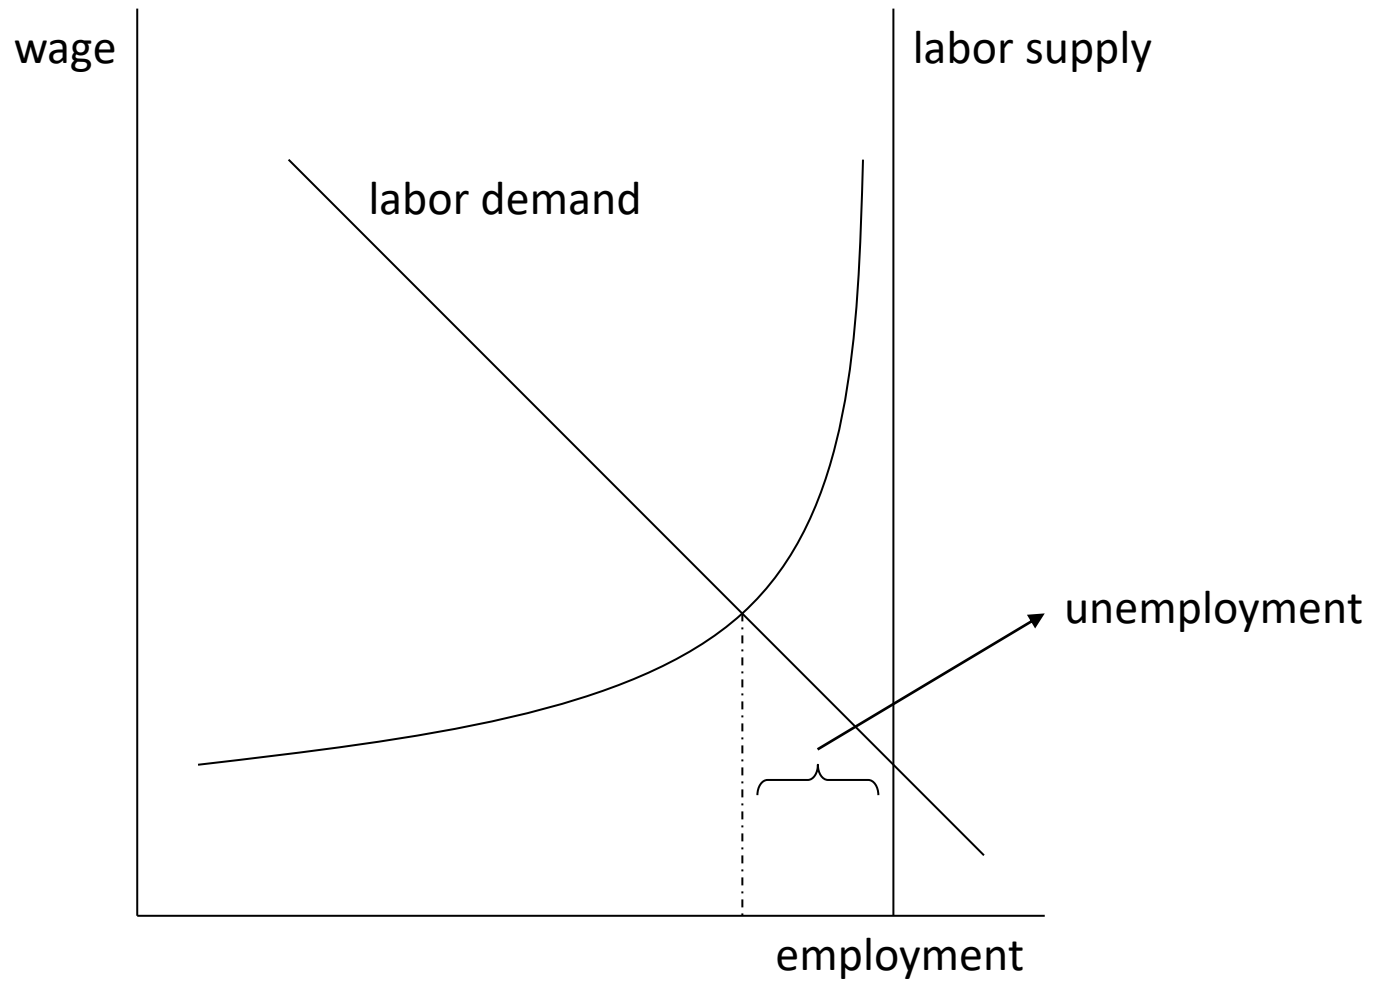

Introduction

- The wage curve (Blanchflower y Oswald, 1994, 2005) captures that “a worker who is employed in an area of high unemployment earns less than an identical individual who works in a region with low joblessness”.
- The negative relationship between wages and unemployment rate is compatible with the existence of efficiency wages, unions with bargaining power, among other "stories".

The Wage Curve

Labor Market

Modifications to the Model

- In this case, we only change the mechanism that determines the equilibrium wage.
- Specifically, we add an equation for the wage curve and the unemployment rate as an endogenous variable.
- In addition, we have to modify the equation that reflects the equilibrium condition in the factor markets.

Modifications to the model – cont.

- Wage Curve added to SOE
 - need to expand model dataset with
 - initial unemployment rate by (labor) factor
 - elasticity of wage w.r.t. unemployment rate by factor; empirically, and for several countries, this elasticity is around -0.1

Nuevos Parámetros y Variables

- En principio, supongamos que solo trabajo puede estar desempleado; se agregan
 - η = elasticidad del salario respecto del (nivel de) desempleo
 - $UERAT$ = tasa de desempleo

Nueva Ecuación y Ecuación Modificada

$$\frac{\frac{WL}{CPI}}{\frac{WL^0}{CPI^0}} = \left(\frac{UERAT}{UERAT^0} \right)^\eta$$

$$\overline{LS}(1 - UERAT) = \sum_{a \in A} LD_a$$

Cambio Calibración

$$\overline{LS} = \frac{\sum_{a \in A} LD_a}{(1 - UERAT)}$$
