Nuevas Ecuaciones

$$QA_a = \varphi_a^{va} \left(\delta_a^L \cdot LD_a^{-\rho_a^{va}} + \delta_a^K \cdot KD_a^{-\rho_a^{va}} \right)^{\frac{-1}{\rho_a^{va}}} \quad \rho_a^{va} = \frac{1}{\sigma_a^{va} - 1}$$

$$LD_a = \left(\frac{PVA_a}{WL \cdot wldist_a} \right)^{\sigma_a^{va}} (\delta_a^L)^{\sigma_a^{va}} (\varphi_a^{va})^{\sigma_a^{va}-1} QA_a$$

$$KD_a = \left(\frac{PVA_a}{WK_a} \right)^{\sigma_a^{va}} (\delta_a^K)^{\sigma_a^{va}} (\varphi_a^{va})^{\sigma_a^{va}-1} QA_a$$

Calibración: Código GAMS

* factor demand for factors without physical quantities:

```
LD0(a)$ldbase(a) = ldbase(a);
```

PARAMETERS

wla(a) wage for factor L in activity a (only for calibration)

costgap(a) gap calibrated factor cost - SAM value (should be zero)

;

* activity-specific wage: payment divided by quantity

```
wla(a)$LD0(a) = SAM('lab',a)/LD0(a);
```

* average wage by L: total payment divided by total quantity

```
WL0 = SUM(a, SAM('lab',a))/SUM(a, LD0(a));
```

* wage distortion factors: activity-specific wage divided by avg wage

```
wldist(a) = wla(a) / WL0;
```

* checking calibration

```
costgap(a) = WL0*wldist(a)*LD0(a) - SAM('lab',a);
```

```
DISPLAY wla, costgap;
```
